

Comments: Ticks via hovering on the wind!

Lyme Disease Association of Australia

Thank you for posting 🙏👍

I am quite sure you are right as I have heard several people tell me that a tick blew onto them in the wind. Will look into the documentary

o Kuik

I think your theory may have a lot of merit. Many years ago I helped a friend clear a large field of black dirt on a very windy day. Not a blade of grass or a tree anywhere in sight. We were absolutely covered in ticks and completely baffled as to how that happened.

Sally S.

I asked my Vet how my dog got ticks when I kept her on a paved path. He said that ticks are so small they can ride on the wind.

Kyle R.

It's not a myth concerning trees. I use to frequent a local park with a pine grove where one jumped from a tree and landed on the back of my neck. I was shocked as the lowest branch up was at least 20' and was told they are repelled by acidic things and these trees are always full of pitch.

Rita K.

I got one trimming bushes in my back yard and another one on my sons field trip. I felt something fall from a tree into my hair. I shook my hair out and about 6 hr. later found it attached to the back of my neck. People who say they aren't in trees I disagree with.

Gin J.

I have seen ticks blown in by the thousands! They are like spiders, they are everywhere!
